ARE YOU CONFIDENT YOUR NETWORK AND INFRASTRUCTURE ARE READY FOR 21ST CENTURY UC?

Every company has exclusive needs, objectives, concerns related to Cloud migration of UC applications. Maybe you've already taken the decision to move to the Cloud but the process has many facets and threats. In FAR Networks we have extensive experience in Microsoft UC technologies, networking and security. We use a multi-dimensional approach, designed for **Office 365** roadmaps, that looks at the business, operational, technology/architectural, resource/cost, and governance aspects of your systems. We get to determine the suitability of your infrastructure for transitioning to 21st century UC and the best fit to meet your expectations.

NETWORK ASSESSMENT

We determine the capacity and capabilities of your network, with a goal of identifying and addressing any problems that may negatively impact UC performance prior to implementation. Between the built in Voice over IP as well as the PSTN Calling functionalities it can sometimes be important to be confident in the network's capability to handle the traffic. Conducting a network assessment before deploying Skype for Business ensures the success of the full UC deployment. We help organizations with ensuring their network meets all the technical requirements necessary for a stable operational infrastructure.

CLOUD JOURNEY ASSESSMENT

Today, more than 75% of companies have a cloud migration strategy. Is your organization prepared for your journey to the Cloud?

In FAR Networks, as Cloud Advisor and Architects, we assist you with a proven methodology and roadmap for low-risk, high-return value.

We study with you how to exploit Skype for Business, Microsoft applications and third party technologies to improve your business, taking into account your size, your business needs to maximize ROI and your current technology performance.

We target immediate issues that should be addressed in the short or near term and architectural changes that should be considered in the future phase design effort. Work breakdown provides you with a complete picture of the activities performed during the project and how they map together to create the required set of deliverables.
